User documentation:

SharedMusic is a music application located at https://shared-music.herokuapp.com/ that allows people to share music quickly and effortlessly. Friends can join rooms together to listen to music together in real-time, as a way to both socialize and discover new music.

The application requires no special installation or set-up. The user simply needs to access the website to begin their experience. This can be done on a web browser.

This application is a shared music player. Everybody who is in the same room will have the same permissions to add users and add songs. The UI shows the currently playing song, upcoming songs, and users in the room based on the user name that they entered. The music plays continuously- we do not allow users to pause songs. They can, however, vote to skip a song. Songs are also played

To use the application, a user can either create a room or join an existing one. Creating a room simply consists of going to the front page of the website and clicking the "create a room" button. From there, you can share the URL with your friends to add them to the room. Whenever you enter a room, you must enter a username for yourself. At this point, whether you created the room or joined an existing one, you can search and add songs that you want to play for everybody. You can search for a song in the search bar and add them to the queue by clicking the plus button next to the search result.

To report a bug, go to our GitHub website at https://github.com/SharedMusic/SharedMusic/issues and add an issue. The link to the github issues page is on the UI. You can look at the current submitted issues at the same link to make sure that you are not submitting a duplicate.
